

ABSTRACT

An information apparatus with access to content is managed by establishing a communication channel between the information apparatus and an output device and receiving over the communication channel an output device profile associated with the output device. The information apparatus obtains one or more image attributes associated with the output device and conforms at least part of the content into one or more output images with the image attributes. The information apparatus generates an output data that includes the output images and is associated with the output device, and delivers the output data to the output device for rendering.
